

D05 | Weather and outage trajectories around the largest >=1 pp increase

Every registered weather channel and all five regimes; columns share a scale within each row.

Lines: original-design-weight means. Bands: pointwise 95% merged-event bootstrap conditional on observed anchors and reference. CAPE, precipitation and snowfall are log1p transformed before standardization; n shows contributing cases across offsets. Stock and net change are shown in percentage points. The shaded region is contemporaneous/retrospective, not forecast information. Precipitation, snowfall and gust at T cover (T-1,T); other weather region is T through T+45 min. These outcome-aligned descriptions neither establish causality nor adjust for multiple comparisons.
